

# On the determination and description of fabric in natural granular materials

Max Wiebicke<sup>1,2</sup>   Edward Andò<sup>2</sup>   Cino Viggiani<sup>2</sup>   Ivo Herle<sup>1</sup>

<sup>1</sup>Chair of soil mechanics and foundation engineering, TU Dresden

<sup>2</sup>Laboratoire 3SR, Grenoble

Aussois, 3rd October 2016

*The full description of micro-mechanical behaviour may be divided into three points:*

- 1. Description of the structure, that is to say, positions of grains and contacts between them.*
- 2. Description of the kinematics evolution: displacements, rotations, evolution of contacts.*
- 3. Description of inter-granular forces.*

from: F. Calvetti, G. Combe and J. Lanier: Experimental micromechanical analysis of a 2D granular material: relation between structure evolution and loading path. *Mechanics of cohesive-frictional materials, VOL. 2, 121-163, 1997*

## What do we want to measure?

### Contact orientation

3D rendering of an  
Sample of Hostun Sand

High resolution Scan  
of Hostun Sand

0 350  $\mu\text{m}$

## How can we measure contact orientations?

### X-ray tomography at a resolution for triaxial tests

Imaged  
Microstructure

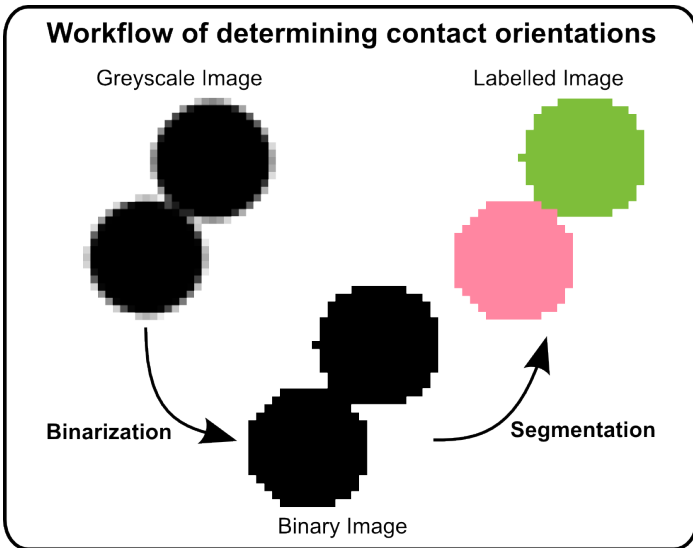

Detection

Orientation

## How can we measure contact orientations?

**How accurate are the standard approaches to determine contact orientations?**

## Strategy to approach the analysis

Perfect spheres

Artificial images

Blurred spheres

Noised spheres

Artificial spheres

Hostun Sand

Real tomographies

# Contact detection

## Artificial spheres

Analytical Spheres

creation of an image of the spheres respecting the partial volume effect: Kalisphaera (Tengattini and Andó, 2015)

Grey-Scale Spheres

Binary Spheres

binarization of the grey-scale image based on a chosen threshold

3D rendering of the image

## Contact detection analysis

distance = 0

blur = 0

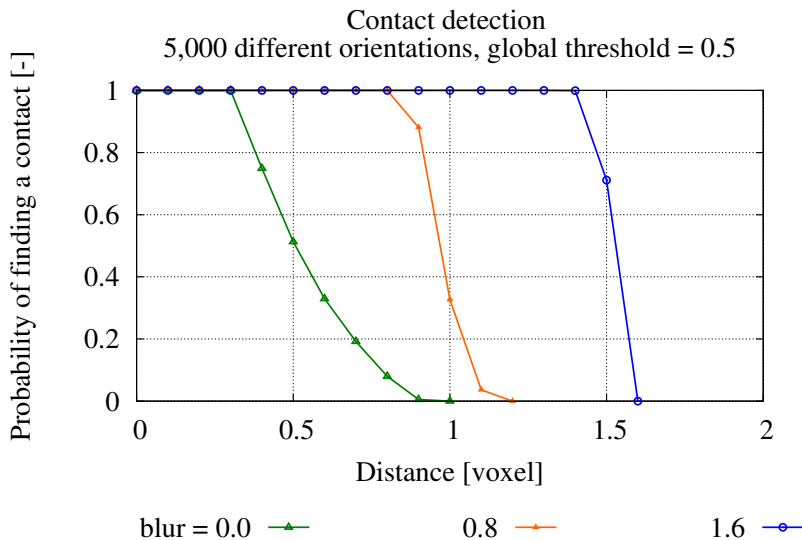

distance = 1 vx

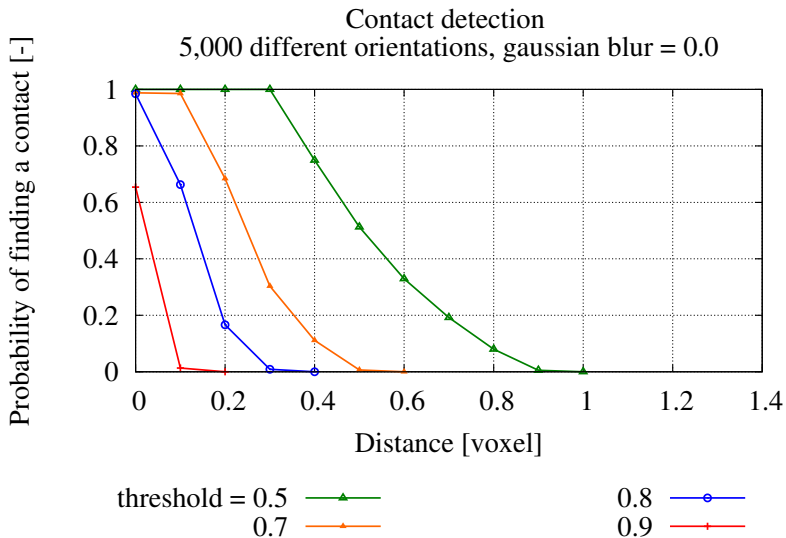

blur = 1 vx

# Contact detection

## Adding noise

## Adding noise to Kalisphera images

I added noise here with the numpy function `numpy.random.normal()` it deviates ( $\sigma$  ... standard deviation) the value of each voxel around the given one (0.25,0.75) in the original array

$\sigma = 0.00$

$\sigma = 0.06$

$\sigma = 0.02$

$\sigma = 0.08$

$\sigma = 0.04$

$\sigma = 0.10$

PSEA01-01

# Contact detection

## Getting real

## Nano X-ray CT's at a resolution of 1 $\mu\text{m}/\text{pixel}$

Ruby Spheres

Hostun Sand

### Contact detection analysis with high resolution images

Grains in high resolution are translated away from each other and scaled down subsequently (for every distance) until a contact can be found

3D rendering of the grains in contact in different distances

distance =  $1\mu\text{m}$

distance =  $4.69\mu\text{m}$

slices of the grains in contact in the distance =  $4.69\mu\text{m}$  at different resolutions

resolution =  $1\mu\text{m}$

resolution =  $10\mu\text{m}$

resolution =  $20\mu\text{m}$

# Contact detection on Ruby spheres Resolution = 5 $\mu\text{m}/\text{vox}$

# Contact detection on Ruby spheres Resolution = 15 $\mu\text{m}/\text{vox}$

# Contact detection on Hostun Sand Resolution = 15 $\mu\text{m}/\text{vox}$

# Contact orientation

## Artificial spheres

## Orientation of Contacts

Lambert azimuthal equal-area  
projection of the imposed  
orientations

- creation of 5,000 pairs of spheres with equally distributed branch vectors
- error is defined as the angle between the orientation and the imposed branch vector

## Artificial spheres

# Contact orientation

## Getting real

## Nano X-ray CT's at a resolution of 1 $\mu\text{m}/\text{pixel}$

Ruby Spheres

Hostun Sand

## Contact Orientation on Ruby spheres

## Contact Orientation on Hostun Sand

## Problems with natural shapes...

### Different scaling effects on contact orientation

visible in this slice:

1. **creation of additional contacts** (see contact detection study)
2. **contact area** - the number of voxels representing a contacts seems to stay relatively constant with scaling - if few voxels serve as a fit, the fit suffers not visible:
3. **contact merging** - if a contact between two grains consists of multiple contact regions and if they are close they might merge when scaling down

Contact 38-48

reso = 1 μm/voxel

error = 21°

but keep in mind that only a slice is visible and the contact is actually 3D

reso = 8 μm/voxel

reso = 16 μm/voxel

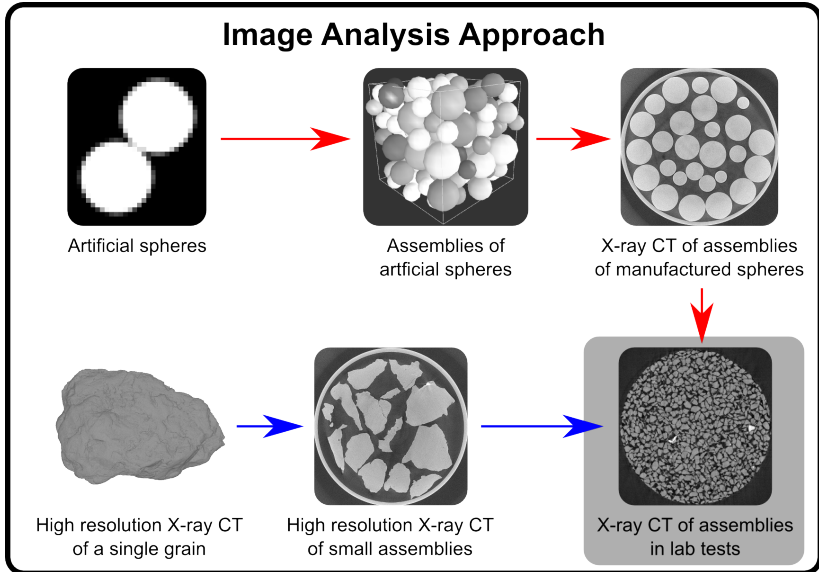

## Going further...

## Summary

- ▶ The standard approach was investigated closely using the scales of interest for X-ray  $\mu$ CT
  - ▶ systematic over-detection of contacts
  - ▶ strong bias on contact orientations
- ▶ The following improvements were found to yield more accurate results
  - ▶ Local thresholding to improve the detection of contacts
  - ▶ Advanced watershed methods to improve the accuracy on contact orientations

## Our approach to contacts
